JavaScript – 20 Real-Time Tasks

Concept-Wise Practice List

1	**Variables (var, let, const)** Create an employee salary calculator that stores basic salary, allowances, and deductions.
2	**Data Types** Create a student profile containing name, age, marks, enrollment status, subjects, and address.
3	**Type Conversion & Operators** Build a shopping bill calculator that converts input prices and quantities into numbers and calculates the final bill.
4	**Conditional Statements** Create an ATM system that checks PIN validity, account balance, and withdrawal eligibility.
5	**Loops** Generate a monthly electricity bill report for multiple customers using loops.
6	**Functions** Create a food delivery bill calculator using reusable functions for subtotal, delivery fee, discount, and total.
7	**Strings** Build a product search feature that searches product names regardless of uppercase or lowercase letters.
8	**Arrays** Create a shopping cart that adds and removes products using array methods.
9	**Array Methods (map, filter, reduce)** Display filtered products, apply discounts, and calculate the total inventory value.
10	**Objects** Create an employee management record with employee details, salary, department, and methods to display information.
11	**DOM Manipulation** Build a dynamic user profile card that updates when a user enters new details.

12	**Events** Create an interactive counter with increment, decrement, and reset buttons.
13	**Forms & Validation** Build a registration form that validates name, email, password, and confirm password.
14	**Scope, Hoisting & Temporal Dead Zone** Create examples demonstrating variable accessibility inside global, function, and block scopes.
15	**Callbacks, Higher-Order Functions & Closures** Build a customizable discount calculator using callbacks and closures.
16	**ES6+ Features** Create an employee directory using destructuring, spread, rest, and optional chaining.
17	**OOP in JavaScript** Build a bank account system using classes, constructors, inheritance, and method overriding.
18	**Asynchronous JavaScript & Event Loop** Create an order processing simulation using callbacks, Promises, timers, and execution-order logging.
19	**Fetch API, Async/Await & Storage** Build a weather application that fetches API data and saves the last searched city in localStorage.
20	**Final Mini Project (DOM + API + CRUD + Local Storage)** Build a product management dashboard with search, filtering, sorting, pagination, add/edit/delete operations, and persistent storage.

7-Day Study Plan

How to complete all 20 tasks in 7 days

Day	Tasks	Concepts	Count
1	1-4	Variables, Data Types, Type Conversion & Operators, Conditional Statements	4
2	5-8	Loops, Functions, Strings, Arrays	4
3	9-11	Array Methods, Objects, DOM Manipulation	3
4	12-14	Events, Forms & Validation, Scope & Hoisting	3
5	15-17	Callbacks & Closures, ES6+ Features, OOP	3
6	18-19	Async JS & Event Loop, Fetch API & Storage	2
7	20	Final Mini Project (DOM + API + CRUD + Local Storage)	1

Why this split

• Days 1-2: the basics are easy, so 4 tasks per day.

• Days 3-5: the topics get harder, so 3 tasks per day.

• Day 6: async and fetch are the hardest concepts, so only 2 tasks.

• Day 7: the mini project uses everything you learned, so the whole day is for it.

• Tip: do 1 hour of revision at the end of each day.
